Description

I encountered an error where email notifications were not being sent from redmine. The problem was a misconfiguration in the **config/configuration.yml** from the redmine folder. I added the correct configuration, similar to the following example:

```
production:
  delivery_method: :smtp
  smtp_settings:
    enable_starttls_auto: true
    address: "smtp.example.com"
    port: 587
    domain: "project.example.com"
    authentication: :login
    user_name: "project@example.com"
    password: "SuperSecretPassword"
```

I also needed to update the **config/application.rb** file and change the following variable from:

```
config.action_mailer.perform_deliveries = false
```

to

```
config.action_mailer.perform_deliveries = true
```
