Description

Installing zoneminder on Ubuntu is a very simple task, as it is included in many distribution repositories by default. This guide will be installing on a minimal Ubuntu 14.04 64-bit system.

- Start by opening a terminal by going to [Menu -> Accessories -> LXTerminal](#)
- Then install the package:

```
sudo apt-get install zoneminder
```

NOTE: This will install apache2 along with any of the dependencies required by zoneminder.

- When the package finished installing, create a symbolic link of the zoneminder web server configuration to the apache sites-enabled folder:

```
sudo ln -s /etc/zm/apache.conf /etc/apache2/sites-enabled/zoneminder.conf
```

- Then restart the web server:

```
sudo service apache2 restart
```

- Finally point your web browser to the zoneminder service at <http://zoneminderIP/zm/>

With the above steps finished the camera server can now be configured to monitor USB cameras, IP cameras, and other camera streams.
