Description I recently took some pictures with my phone, and when I went to upload them to a web service they were upside down for some reason. It turns out that the orientation of an image is stored in the exif data of a photo. <ul style="list-style-type: none">To start I made a directory for the fixed images:<pre>mkdir ~/fixed</pre>To fix this, I stripped the exif data:<pre>mogrify -strip -path ~/fixed images/*.jpg</pre>Then flipped the images<pre>mogrify -flip -flop ~/fixed/*.jpg</pre>
