Description

I recently had a user having emails stuck in their email client's outbox. After doing some initial troubleshooting I found that one of the recipient addresses had a space in it, causing the email to be malformed and undeliverable.

- Looking around in the maillog:

```
cat /var/log/maillog
```

#I found the following error message:

```
Jun  6 16:51:59 mail postfix/smtpd[35766]: 834C4A3FAA: reject: RCPT from unknown[192.168.1.147]: 450 4.7.1 <SOME otheruser@example.com>: Recipient address rejected: Access denied; from=<user@example.com> to=<SOME otheruser@example.com> proto=ESMTP helo=<android-5215693721918913.example.com>
```

To work around this problem, I used the `command_filter` feature provided by postfix (version 2.7+) and created a regular expression to put quotations around any email addresses matching with a space.

- Create the `command_filter` file:

```
vi /usr/local/etc/postfix/command_filter
```

- And add the following:

```
# Regular expression to match addresses with spaces, then put quotes around it
/^RCPT\s+TO:<([^\s[:space:]]+ .+)([^\s[:space:]]+>.*)/ RCPT TO:<"$1"@$2
```

- Now edit the main postfix config file:

```
vi /usr/local/etc/postfix/main.cf
```

- And add the `command_filter` definition, along with `smtpd_reject_unlisted_recipient`:

```
smtpd_command_filter = pcre:/usr/local/etc/postfix/command_filter
smtpd_reject_unlisted_recipient = no
```

- Restart postfix:

```
service postfix restart
```

NOTE: This does not magically correct wrong email address. Incorrect email addresses will either bounce back to the sender or be

caught by a catch-all email box.
