<b>Description</b>			
I encountered a problem with redmine where it would not send email. After checking the production.log I found the following error:			
Email delivery error: hostname does not match the server certificate			
It turns out I needed to add the following to the configuration.yml:			
<pre># default configuration options for all environments default:   # Outgoing emails configuration (see examples above)   email_delivery:     delivery_method: :smtp     smtp_settings:       address: smtp.example.com       port: 587       domain: example.com       authentication: :login       user_name: "root@example.com"       password: "SuperSecretPassword"       openssl_verify_mode: 'none'</pre>			
The last line <b>openssl_verify_mode: 'none'</b> is what relaxed the certificate checking.
