Description

I encountered the need to be able to log into the same Windows 7 machine with different users also having the ability to user the machine. Unfortunately, Microsoft does not allow multiple concurrent users to be connected using RDP. One developer found a solutions to this and packaged an executable that modifies the necessary files and creates backups of the original files before modification. All that is needed is extract and run the included file.

NOTE: Make sure to run the correct executable; if running 32-bit run the x86 version, else if running 64-bit run the x64 version.

Yes, it really is that simple.

History
