Category:		Estimated time:	0.20 hour
Target version:		Spent time:	0.50 hour

Description

I encountered a problem while setting up a PHP web application on an nginx web server. I managed to find a solution that increases the timeout values.

1. Open your nginx.conf file located in /etc/nginx directory

```
vi /usr/local/etc/nginx/nginx.conf
```

- Add this below piece of code under http { section

```
client_header_timeout 3000;
client_body_timeout 3000;
fastcgi_read_timeout 3000;
client_max_body_size 32m;
fastcgi_buffers 8 128k;
fastcgi_buffer_size 128k;
```

1. Reload Nginx and php5-fpm

```
service nginx reload
service php5-fpm reload
```

If the error persists (which is rare), consider increasing the values.
