Description			
<p>While I was doing some traveling, I decided to use my phone for navigation using OsmAnd. However, when I opened the app I did not get a lock from any of the GPS satellites. While browsing around I found an app that fixed the problem for me, called FasterFix; root is required. How I fixed it was:</p> <ol style="list-style-type: none">1. Download and install FasterFix2. Open FasterFix and allow temporary root access (10min.)3. Select North America from the pull-down menu4. Tap Go <p>This fixed my GPS problem.</p> <p>UPDATE 1: I updated my ROM to a newer version and some how broke the FasterFix workaround. However I found another app that fixed the issue, called GPS Test. Once installed I opened up <u>Menu -> Update AGPS</u></p>
