Description

This is a guide for installing the fail2ban plugin on roundcube on FreeBSD 9.

Install Fail2ban Plugin

- Clone the repo:

```
cd /usr/local/www/roundcube/plugins
git clone git://github.com/mattrude/rc-plugin-fail2ban.git fail2ban
```

- Edit the main roundcube config:

```
vi /usr/local/www/roundcube/config/config.inc.php
```

- And add fail2ban to the plugins array:

```
$config['plugins'] = array(
    'archive',
    'zipdownload',
    'fail2ban',
);
```

Configure fail2ban

- Create the filter regex:

```
vi /usr/local/etc/fail2ban/filter.d/roundcube.conf:
```

- And add the following:

```
[Definition]
failregex = FAILED login for .* from <HOST>
ignoreregex =
```

- Then create the jail config:

```
vi /usr/local/etc/fail2ban/jail.d/roundcube.conf
```

- And add the following:

```
[roundcube]
enabled = true
```

```
port      = http,https
filter    = roundcube
action    = ipfw
logpath   = /usr/local/www/roundcube/logs/userlogins
```

- Restart fail2ban to apply the new configs:

```
service fail2ban restart
```
